

What is a raid battery backup unit (BBU)?

RAID controllers come with a dedicated battery, the RAID battery, that works to preserve the controller's cache memory in the event of sudden power loss. In this blogpost, we're talking RAID battery backup units (BBUs) - what they're good for, how they do what they do, and why it's so helpful to have them around. What's a RAID battery?

What is a backup battery?

To supply emergency backup power in the event of a power disruption so that no data is lost or corrupted. Above: these batteries are often mounted directly onto the RAID controller card, attached via a short cable to supply backup power to cache when needed. May be located in the enclosure holding the controller.

What is a battery backup unit (BBU or BBM)?

With corresponding protective mechanisms, the content of these caches would be lost when a power failure occurs. For that reason, the cache content is often protected by a BBU or BBM (depending on the manufacturer, either the term Battery Backup Unit (BBU) or Battery Backup Module (BBM) is used).

What is a raid battery?

A RAID battery (also known as a RAID cache protection battery or Battery Backup Unit) is a key component installed on a RAID controller card. These small battery units connect directly to the card in your server, workstation, or external disk array. Their sole job?
