

What type of Spackle do I Need?

In general, lightweight spackle types work great for quick and minor fixes indoors, while heavier-duty options like acrylic are durable enough for larger cracks or exterior walls. Choosing the correct type of spackle for your project is crucial for achieving a high-quality finish, efficiency, and long-term durability.

What is Spackle used for?

When prepping a wall for painting, spackle helps you fill imperfections and create a smooth surface. In their most basic form, standard spackling compounds are pastes, often made from gypsum powder, other binders, and liquid. However, there are quite a few formulas out there -- so which spackle is right for the job?

What is a lightweight Spackle?

Known for being easy to apply, layer, and sand, lightweight spackles are best for covering nail holes, minor cracks, and dents in drywall. This spackle type is typically composed of a binder, such as acrylic or vinyl, and a lightweight filler, like microballoons or perlite.

What is epoxy Spackle?

Epoxy resin and a hardener combine to form an ultra-durable type of spackle. A unique factor of epoxy spackle is that it usually comes as a two-part system, where the resin and hardener come separately, and you must mix them before use. Considered one of the longest-lasting spackles, epoxy offers some of the best strength and moisture resistance.
